ANALIZA DANYCH EPIDEMIOLOGICZNYCH

Aleksandra Gomółka, Szymon Szrajer • WBBIB UJ

- Analiza danych dotyczących wirusa COVID-19.
- Pozyskiwanie i wizualizacja danych za pomoca programów takich jak: LaTeX, Bash, Gnuplot, PyCharm.
 - Porównanie uzyskanych, rzeczywistych
 - wyników z danymi modelowymi.

W celu pozyskania danych skorzystaliśmy ze strony: https://www.worldometers.info.

rm 3totzgonv1.csv 3totzgonv2.csv
```

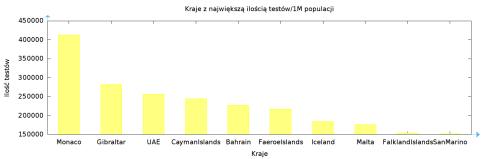

#1/bin/bash

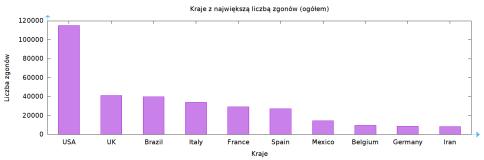

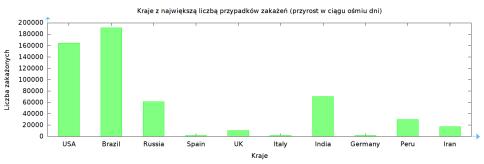

- Jeżeli było to konieczne dane reorganizowaliśmy w programie Excel.
- Na podstawie uzyskanych plików w formacie .dat wykreśliliśmy wykresy.
- Wykresy stworzone w programie Gnuplot przedstawiają dane dla państw, które stoją na czele w danych kategoriach.

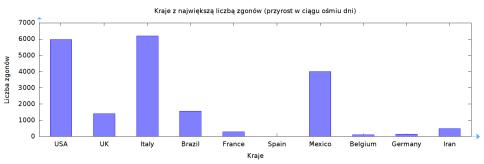

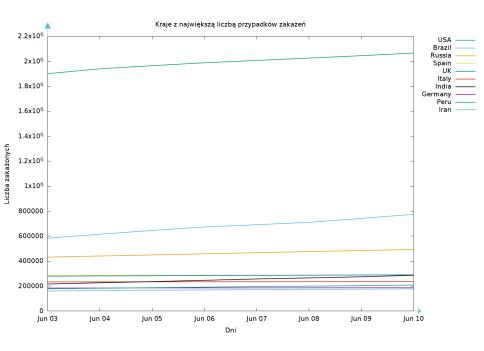

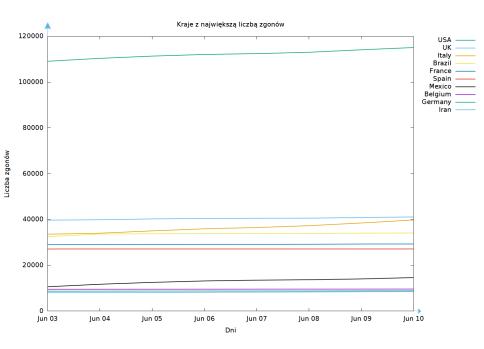

Korzystając z języka programowania Python stworzyliśmy

interpretację modelu SIR(Suspectible, Infected, Recovered) aby sprawdzić jak dane rzeczywiste mają się do tych, które przewiduja modele.

```
import numpy as np
from scipy.integrate import odeint
import matplotlib.pyplot as plt
```

```
N = 37848924 #populacja
```

I = 24687 # osoby zarażone na w pierwszym dniu badania beta = 1.4 # liczba kontaktów dziennie

K = 14 # średni czas trwania infekcji wyrażony w dniach time = 8 # liczba dni oznacza czas brany pod uwagę podzczas badań

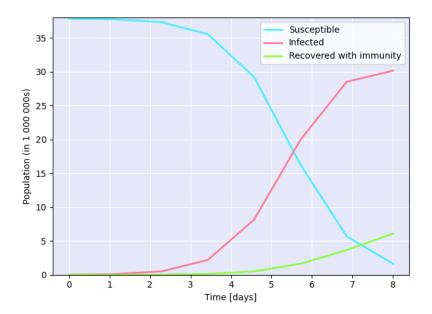

```
R = 0 # początkowa liczba osób, które wyzdrowiały
S = N - I - R # liczba osób podatnych na zakażenie
k = 1/K # współczynnik wyzdrowień
t = np.linspace(0,time,time) # siatka punktów czasowych, oś x
```

funkcja generująca równania różniczkowe

def derivatives(y, t, N, beta, k):

```
S, I, R = y
dSdt = -beta * S * I / N
dIdt = beta * S * I / N - k * I
dRdt = k * I
return dSdt, dIdt, dRdt
```

```
# wukreślenie danuch na trzech osobnych krzywych dla S(t), I(t) i R(t)
# kolor tła
backg = plt.figure(facecolor='w')
# opis osi
axis = backq.add_subplot(111, facecolor='#E5E8f9', axisbelow=True)
axis.set_xlabel('Time [days]')
axis.set_ylabel('Population (in 1 000 000s)')
# wykresy SIR, czas, wartości, kolor, szerokość, nazwa
axis.plot(t, S/1000000, '#46F0FF', lw=2, label='Susceptible')
axis.plot(t, I/1000000, '#FF7996', lw=2, label='Infected')
axis.plot(t, R/1000000, '#8EFF3B', lw=2, label='Recovered with immunity')
# ograniczenie osi y
axis.set_ylim(0, 38)
# "linie" - widoczne, które, kolor, szerokość, stul
axis.grid(b=True, which='both', c='w', lw=1, ls='-')
#legenda
legend = axis.legend()
plt.show()
print(I)
```

Prezentację wykonaliśmy w programie LaTeX na podstawie bazowej klasy "fancyslides", którą później modyfikowaliśmy dla potrzeb określonego slajdu.
